

SysKit Monitor Architecture

Agentless monitoring and supported technologies

SysKit Monitor can be installed on a dedicated server or on any existing server that you have on the farm. It is important to note that SysKit Monitor will not deploy any agents or install anything on your servers. We use an RDP/ICA API, which allows us to capture data from remote servers without any software being deployed.

SysKit Monitor supports:

- Windows Servers and Workstations
- Citrix XenApp/XenDesktop
- Remote Desktop Services
- SQL and SharePoint servers
- Remote Desktop Gateway
- VMWare Horizon.
