Logical Server Groups

Organize your monitoring environment into logical server units

By using **Logical Server Groups**, SysKit Monitor helps you maintain and monitor systems with a large number of servers. Assign servers into logical groups reflecting their server environments, such as DEV, QA, or Testing, to produce smaller monitoring fractions. You can also **apply specific actions to targeted servers** while your other logical groups stay intact. This useful when you need to generate reports for specified environments, and it **reduces the risk** of applying unwanted patches on production and live servers.
